

### **Forecasting Mine Stability:**

Mine Stability is a rock mechanics concept that is becoming an engineering specialty in its own right. Beck Arndt Engineering will hold a one day seminar on mine stability in Perth on Monday, 5 March 2007.

The topics covered will include:

- Mine instability phenomena
- Direct model calibration
- Useful field measurements and instrumentation
- Predicting deformation in major infrastructure
- Stability of Deep Open pits
- Latest developments in seismological forecasting

The seminar will include a number of case studies involving back analysis and direct simulation of mine scale deformation. There will be a strong focus on mine scale, non linear numerical modelling and practical mining engineering.

There will only be 20 places at this seminar, so please book your place as soon as possible.
